

AI LITERACY

Using AI well is a skill, not a subscription

Four habits that separate a useful answer from a merely plausible one.

Search box vs working session

Search box

One line in, one answer out, accept it.

Working session

Context, constraints, a draft, then a deliberate challenge.

Context

Who you are, what you already tried, what a good answer would contain. Most bad outputs are underspecified inputs.

The challenge step

1. Ask what it is least sure about.
2. Ask for the strongest case against.
3. Ask what it would need to check.

14.66%

How often a model that had given the correct answer abandoned it for a wrong one after the user pushed back.

THE POINT

*Framing changes the answer
before the model knows anything*

Asking a question and asserting the same thing produced answers about 24 percentage points apart.

Match the job to the reliability

**Summarise a document
you supply**

2 to 5% error

**Short factual recall with
no tools**

Around 40%

Same model, different task.

The skill is verification, not prompting

Anyone can get an answer out of it. The value is knowing which answers to keep.
