

AI

Using AI well is a skill. Using it a lot is not.

What separates people who get real work out of a model from people who get fluent-sounding mush.

DEFINITION

Fluency is not competence

Being comfortable with a tool means you use it without friction.

It says nothing about whether the output is correct, or whether you would notice if it was not.

Two ways to ask

“write me something
about climate policy.”

“here is my audience,
my constraint, my
draft, and what I think
is weak about it.”

Same tool, completely different job.

Three ways it fails

1

It agrees with you.

2

It invents details that fit the shape of an answer.

3

It answers past the edge of what it knows, in the same confident register.

**The question is
not what it can do**

“

*The useful question is which part
of the thinking you just handed
over, and whether you needed
that part.*

Where it helps, where it hollows out

Drafting

helps

Summarizing what you already read

helps

Doing the reading for you

hollows out

Checking your logic

helps

Supplying the logic

hollows out

Verification is the whole skill

If you cannot tell whether the answer is right, you are not using the tool, you are trusting it.
